Professional Summary

Backend-focused software engineer with 10+ years of commercial experience building and maintaining production systems with Elixir, Phoenix, Ruby on Rails, and PostgreSQL. Experienced in designing distributed messaging systems, real-time communication, asynchronous processing, API platforms, and data-intensive applications. Has taken end-to-end ownership of system architecture and implementation, from backend services and infrastructure to web, desktop, and mobile client features. Strong focus on reliability, database performance, and pragmatic engineering decisions.

Core Competencies

Backend Architecture & System Design | Distributed Systems & Actor Model | Real-time Messaging & WebSockets | API Design & Third-party Integrations | Asynchronous Processing & Background Jobs | PostgreSQL Performance & Query Optimization | High-volume Data Processing | Production Systems & Reliability | Technical Ownership & Code Review

Technical Skills

Languages	Elixir, Ruby, Go, TypeScript, JavaScript, SQL, CoffeeScript
Backend & Frameworks	Phoenix, Ruby on Rails, Absinthe, GraphQL, REST, Grape, Sidekiq, GenServer
Messaging & Real-time	Redis, Redis Streams, AnyCable, AnyCable-Go, WebSockets, RabbitMQ
Databases	PostgreSQL, PostGIS
Infrastructure & Cloud	AWS, Kubernetes, Docker, FFmpeg
Client Development	React, React Native, Electron, jQuery
Engineering Practices	Automated Testing, Code Review, API Design, Performance Optimization

Languages

Russian — Native | **English** — Upper-Intermediate (B2)

Professional Experience

Senior Software Engineer

Sep 2020 – Present

Biz Launch Equity, Inc.

Worked across backend services and client applications, designing and implementing distributed systems, real-time messaging, webinar streaming, and product features. Contributed to architecture and technical decisions, production development, code reviews, and support across web, desktop, and mobile clients.

Distributed Messaging Platform

- Architected and implemented a distributed messaging system using Elixir, Redis Streams, AnyCable, and AnyCable-Go.
- Built the Elixir-side message publishing flow, using Redis Streams to pass messages to AnyCable for delivery.
- Used AnyCable-Go to deliver real-time messages to connected clients over WebSockets, with two AnyCable-Go instances deployed.
- Developed a TypeScript service from scratch to filter and authorize messages, ensuring users received only messages they were allowed to access.
- Implemented retryable background processing so jobs could be retried after temporary database or service failures.
- Designed the system to serve multiple independent clients and projects.

Webinar Streaming Service

- Designed and built a webinar streaming service from scratch, integrating with the Facebook Live API.
- Implemented streaming orchestration in Elixir using GenServers and the actor model, with FFmpeg handling media processing and streaming.

Product & Client Applications

- Delivered production features and bug fixes across web applications built with React and TypeScript, an Electron desktop application, and React Native mobile applications.
- Worked across backend services written in Elixir and Ruby on Rails, as well as client applications, when product tasks required end-to-end changes.

Engineering Ownership

- Participated in system-wide architecture discussions and made technical decisions for owned projects.
- Performed code reviews, supported other developers, and took responsibility for implementation and production troubleshooting.

Technologies: Elixir, Ruby on Rails, Sidekiq, PostgreSQL, Redis, Redis Streams, AnyCable, AnyCable-Go, WebSockets, TypeScript, JavaScript, React, React Native, Electron, AWS, Kubernetes, Docker

Senior Backend Engineer

Feb 2018 – Aug 2020

Wellnuts, Ltd.

Developed backend systems for vehicle telematics and related services, working primarily with Elixir, Phoenix, Ruby, PostgreSQL, and GraphQL. Built independent services, worked with geospatial data, and optimized data-intensive application workflows.

Vehicle Trip Simulator

- Designed and implemented a trip simulator using Elixir GenServers and the actor model.
- Replayed existing vehicle trips based on telemetry received from in-vehicle devices, dynamically adding, replacing, or removing data packets and dispatching them at scheduled times to simulate a live trip.

Backend APIs & Data Services

- Developed and maintained GraphQL APIs using Absinthe, alongside REST endpoints.
- Implemented vehicle clustering for map visualization using PostgreSQL and PostGIS, and applied additional geospatial database capabilities where needed.
- Built a Go-based SFTP service integrated with AWS S3.
- Worked with Redis and RabbitMQ as part of backend service and messaging infrastructure.

Performance & Reliability

- Optimized PostgreSQL queries and reporting workflows, including query restructuring, joins, and indexing.
- Split selected complex reporting operations into multiple queries to enable parallel execution where appropriate.
- Used background jobs to generate report files when required.

Technologies: Elixir, Phoenix, GenServer, Ruby, Go, GraphQL, Absinthe, REST, PostgreSQL, PostGIS, Redis, RabbitMQ, AWS, Kubernetes, Docker

Backend Engineer

May 2016 – Feb 2018

Modus Group, LLC (Radius Telematics)

Worked primarily on Ruby on Rails backend development for a vehicle telematics platform, with additional contributions to an Elixir API used by client applications.

Backend Development

- Developed and maintained backend functionality using Ruby on Rails, Sidekiq, and PostgreSQL.
- Maintained and extended an Elixir API serving client applications.
- Developed and optimized REST API endpoints using Grape.
- Used background workers extensively for trip ingestion and processing, notifications, and other asynchronous workflows.

Database & Reporting Performance

- Optimized PostgreSQL queries and reporting workflows across large vehicle telemetry datasets.
- Worked with datasets typically containing tens or hundreds of millions of trips; one client database contained more than 10 billion recorded trips.
- Improved report performance through SQL query optimization, join restructuring, indexing, and background file generation.

Application Refactoring

- Refactored complex application callbacks and moved business logic into dedicated service objects to improve maintainability and execution flow.

Technologies: Ruby, Ruby on Rails, Grape, Sidekiq, Elixir, Phoenix, PostgreSQL, PostGIS, Redis, AWS, JavaScript, CoffeeScript, jQuery
